

Bulletin - State Geological and Natural History Survey of Connecticut Volume 3

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1905 Excerpt: ... the spores. *Crepidotus applanatus* Pers. (made level). Mansfield, July (146). Plate XXI. *Pholsota solsmrosoidrs*. Viscid-scur-y *Pholiota*. (Natural size.) Cap fleshy, viscid when moist, densely covered with erect, tawny scales; gills white at first, then cinnamon color; ring thick, floccose; stem rough with thick scurfy scales. Plate XXII. *Crrpidotss malachsss*. (Natural size.) Cap gray; stem short. *Crepidotus crocophyllus* Berk. (, saffron; (pvWov, leaf; referring to color of gills). Mansfield, July (127). *Crepidotus malachus* B. & (mallow-colored). Mansfield, Aug. (96). Plate XXII. *Crepidotus dorsalus* Pk. (dorsum, back). Mansfield, July (126). *BOLBITIUS* Fr. ?oX?irov, dung; referring to place of growth. This small genus is interesting because of a peculiarity of the gills, which dissolve as the plant reaches maturity, but do not deliquesce into a watery substance, as do the species of *Coprinus*. The cap is fragile, yellowish in color, and usually very mucilaginous in consistency, especially in moist weather. As the generic name signifies, these plants usually grow on dung, but are sometimes found growing on decaying leaves. *B. variicolor* was found abundantly under shrubs which had been heavily manured the previous fall. The spores are of a rusty-red color, and collect in large numbers upon the mature gills. But two species are reported. *Bolbitius fragilis* (L.) Fr. (fragile). East Hartford, Hanmer. *Bolbitius variicolor* Atk. (variously colored). Mansfield, May (22). *INOCYBE* Fr. ic, fiber; Kv?f/, head; fibrous cap. The surface of the cap of the plants in this genus is more or less thickly coated with fine hairs or fibrils, the remnants of a universal veil. The gills are joined to the

stem by a ...
