

British mineralogy Volume 1; or, Coloured figures intended to elucidate the mineralogy of Great Britain

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1804 Excerpt: ...irregular and loose, as it sometimes is, appears by the description to be the smut of this author. Culm means only smallish coals of inferior value, which do not pay duty. Some of the Swansea coals resemble the Denbigh coals in their structure, and are nearly the same in quality. This upper figure has the charcoaly and stratified part in various directions. Some parts resemble burnt straw in regular rows: others form conical appearances, converging or diverging from a centre. We also find horizontal and oblique strata. The shining part is in various directions, with a confused and shattered appearance. Some of the striated parts were slightly covered with charcoal in fine dust, easily rubbed off, the striated impression still remaining in immediate contact with the shining part. In other parts were thick layers of charcoal in irregular strata, but somewhat horizontal to the other parts, the whole having a peculiar, yet confused, appearance. It is very brittle, and easily shattered to pieces. The lower piece is much tougher, and the striae have not a vestige of charcoal about them, nor will they soil the fingers. This seems altogether more indurated. These two and the Denbigh coal have nearly the same qualities as to their uses. They are difficult to ignite, and burn without flame, remaining a long while, and giving a great heat, without much apparent change; whence they have been denominated Stone Coal. They are used for malting, and for burning lime, and are frequently mixed with such coals as will more readily inflame, to assist the burning. They are supposed to contain less oxygen with the carbon than other coals, and therefore require the assistance of those which contain more oxygen. It may not be amiss

to observe here that diamonds require oxyge...
