

## Bulletin of the American Museum of Natural History Volume 8

This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1896 edition. Excerpt: ...surface pits. The thin, dull-black crust has been broken off in spots, revealing the dark gray interior with minute metallic points scattered through it. This is the fall entered as West Liberty in the British Museum catalogue of meteorites. (Purchased from H. T. Woodman.) Mocz, Transylvania. A complete, wedge-shaped individual. The comparatively thick, dull-black crust is intersected by a network of line cracks. The interior is gray with small brown spots in it, and with numerous line veins and particles of iron scattered through it. (Spang Coll.) Two smaller complete individuals presenting the same characters. (Spang Coll.) With Plates III And IV, And Fifteen Figures In The Text The rapid evolution of the Titanotheres (during the deposition of about 180 feet of sediment in the Oligocene White River Beds is one of the striking chapters in mammalian history which is still only partly understood. The following study of the evolution of the cranium is chiefly an attempt to distinguish the influences of sex, of age or form, and of individual variation from the truly retrogressive and progressive characters. It is written to this end, but unfortunately we cannot intelligibly treat the morphology of Titanotherium without first clearing out the Augean stable of nomenclature. The greater number of the thirteen generic and thirty-one specific terms which have been proposed are either undefined or (indefinable, or are based upon non-specific or non-generic characters. The materials examined in connection with this study are: Copes type skulls and jaws now in the American Museum collection; eighteen skulls mostly collected, partly purchased, for the Museum in the

expeditions of 1892 and 1894 by Dr. Wortman and Mr. Peterson; the...
