

Impacts of Climate Change on the Intermountain West

The purpose of the hearing is to talk about the impacts of climate change on the Intermountain West. During the early part of this year the fire season involved intense wildfires here in New Mexico and Colorado, across the Western United States. Many of those wildfires are continuing, of course, in the Northeast or Northwest part of the country in Washington and Oregon today threatening population centers, destroying hundreds of homes. The intent of this hearing is to receive testimony that puts these recent fires into a greater historical context to unravel the factors that contributed to their severity and to understand how climate change has and is expected to continue to change the landscape and ecosystems of the Intermountain West. This hearing will focus primarily on the broad impacts of climate change including increased wildfires, widespread damage to ecosystems and the potential for greater drought conditions.
